

RDBMS	MongoDB
Select StudRollNo, StudName, Hobbies From Students Where Grade ='VII' and Hobbies ='Ice Hockey'	db.Students.find({Grade: 'VII' , Hobbies: 'Ice Hockey'}, {StudRollNo : 1, StudName: 1, Hobbies : 1, _id:0})
Select StudRollNo, StudName, Hobbies From Students Where Grade ='VII' or Hobbies = 'Ice Hockey'	db.Students.find({ \$or: [{Grade: 'VII' , Hobbies: 'Ice Hockey'}], StudRollNo : 1, StudName: 1, Hobbies : 1, _id:0})
Select * From Students Where StudName like 'S%'	db.Students.find({ StudName: / ^A S/}).pretty()

6.5 MONGODB QUERY LANGUAGE

CRUD (*Create, Read Update, and Delete*) operations in MongoDB

- Create** → Creation of data is done using insert() or update() or save() method.
- Read** → Reading the data is performed using the find() method.
- Update** → Update to data is accomplished using the update() method with UPSERT set to false
- Delete** → a document is Deleted using the remove() method.

We will present the various methods available in MongoDB shell to deal with data in the next few sections. The sections have been designed as follows:

- Objective:** What is it that we are trying to achieve here?
- Input:** What is the input that has been given to us to act upon?
- Act:** The actual statement/command to accomplish the task at hand.
- Outcome:** The result/output as a consequence of executing the statement.

At few places we have also provided the equivalent in RDBMS such as Oracle.

Objective: To create a collection by the name “Person”. Let us take a look at the collection list prior to the creation of the new collection “Person”:

```
C:\Windows\system32\cmd.exe - mongo
> show collections
Students
food
system.indexes
system.js
>
```

Act: The statement to create the collection is
`db.createCollection("Person")`

```
C:\windows\system32\cmd.exe - mongo  
> db.createCollection("Person");  
< "ok" : 1 >
```

Outcome: Below is the collection list after the creation of the new collection “Person”:

```
C:\windows\system32\cmd.exe - mongo  
> show collections;  
Person  
Students  
Food  
System.indexes  
System.js  
>
```

Objective: To drop a collection by the name “food”.

Take a look at the current collection list:

```
C:\windows\system32\cmd.exe - mongo  
> show collections;  
Person  
Students  
Food  
System.indexes  
System.js  
>
```

Act: The statement to drop the collection is
`db.food.drop();`

```
C:\windows\system32\cmd.exe - mongo  
> db.food.drop();  
true  
>
```

Outcome: The collection list after the execution of the statement is as follows:

```
C:\windows\system32\cmd.exe - mongo  
> show collections  
Person  
Students  
System.indexes  
System.js  
>
```

6.5.1 Insert Method

We now explain the syntax of insert method.

```
db.students.insert(  
[  
  RollNo: 101,  
  Age: 19,  
  ContactNo: 0123456789,  
  EmailID: Sample@abc.com  
])
```

← Collection
← Field: value
← Field: value
← Field: value
← Field: value

Objective: To create a collection by the name “Students” and insert documents.

Input: Check the list of existing collections.

```
C:\windows\system32\cmd.exe - mongo
> show collections
system.indexes
system.js
>
```

Act: Create a collection by the name “Students” and store the following data in it.

```
db.Students.insert({_id:1, StudName:"Michelle Jacintha", Grade: "VII", Hobbies: "Internet Surfing"});
```

```
C:\windows\system32\cmd.exe - mongo
> db.Students.insert({_id:1, StudName:"Michelle Jacintha", Grade: "VII", Hobbies: "Internet Surfing"});
> writeResult({ "nInserted" : 1 })
```

Outcome: Check if the collection has been successfully created.

```
C:\windows\system32\cmd.exe - mongo
> show collections
Students
system.indexes
system.js
>
```

Check if the document for Student “Michelle Jacintha” has been successfully inserted into the “Students” collection.

```
C:\windows\system32\cmd.exe - mongo
> db.Students.find();
> { "_id" : 1, "StudName" : "Michelle Jacintha", "Grade" : "VII", "Hobbies" : "Internet Surfing" }
```

To format the result, one can add the pretty() method to the operation.

```
C:\windows\system32\cmd.exe - mongo
> db.students.find().pretty();
{
  "_id" : 1,
  "StudName" : "Michelle Jacintha",
  "Grade" : "VII",
  "Hobbies" : "Internet Surfing"
}
```

Objective: Insert another document into the collection.

Input: Check the documents in the “Students” collection before proceeding.

```
C:\windows\system32\cmd.exe - mongo
> db.Students.find().pretty();
{
  "_id" : 1,
  "StudName" : "Michelle Jacintha",
  "Grade" : "VII",
  "Hobbies" : "Internet Surfing"
```

Act:

```
db.Students.insert({_id:2, StudName:"Mabel Mathews", Grade: "VII", Hobbies: "Baseball"});
```

```
C:\windows\system32\cmd.exe - mongo
> db.Students.insert({_id:2, StudName:"Mabel Mathews", Grade: "VII", Hobbies: "Baseball"});
WriteResult({ "ninserted" : 1 })
```

Outcome:

```
C:\windows\system32\cmd.exe - mongo
> db.Students.find().pretty();
{
    "_id" : 1,
    "StudName" : "Michelle Jacintha",
    "Grade" : "VII",
    "Hobbies" : "Internet Surfing"

    "_id" : 2,
    "StudName" : "Mabel Mathews",
    "Grade" : "VII",
    "Hobbies" : "Baseball"
```

Objective: Insert the document for “Aryan David” into the Students collection only if it does not already exist in the collection. However, if it is already present in the collection, then update the document with new values. (Update his Hobbies from “Skating” to “Chess”.) Use “**Update else insert**” (if there is an existing document, it will attempt to update it, if there is no existing document then it will insert it).

Input: Check the documents in the “Students” collection before proceeding.

```
C:\windows\system32\cmd.exe - mongo
> db.Students.find().pretty();
{
    "_id" : 1,
    "StudName" : "Michelle Jacintha",
    "Grade" : "VII",
    "Hobbies" : "Internet Surfing"

    "_id" : 2,
    "StudName" : "Mabel Mathews",
    "Grade" : "VII",
    "Hobbies" : "Baseball"
```

Act:

```
db.Students.update({_id:3, StudName:"Aryan David", Grade: "VII"}, {$set:{Hobbies: "Skating"}}, {upsert:true});
```

```
C:\windows\system32\cmd.exe - mongo
> db.Students.update({_id:3, StudName:"Aryan David", Grade: "VII"}, {$set:{Hobbies: "Skating"}}, {upsert:true});
WriteResult({ "nMatched" : 0, "nUpserted" : 1, "nModified" : 0, "_id" : 3 })
```

Outcome: Confirm the presence of the document of “Aryan David” in the “Students” collection.

```
C:\windows\system32\cmd.exe - mongo
> db.Students.find({_id:3});
{
    "_id" : 3, "Grade" : "VII", "StudName" : "Aryan David", "Hobbies" : "Skating" }
```

Objective: Insert the document for “Aryan David” into the Students collection only if it does not already exist in the collection. However, if it is already present in the collection, then update the document with new values. (Update his Hobbies from “Skating” to “Chess”). Use “**Update else insert**” (if there is an existing document, it will attempt to update it, if there is no existing document then it will insert it). Try the UPSERT operator by setting it first to “true” and then to “false” and observe the output.

Input: Check the documents in the “Students” collection before proceeding.

```
C:\Windows\system32\cmd.exe - mongo
> db.Students.find().pretty();
{
  "_id" : 1,
  "StudName" : "Michelle Jacintha",
  "Grade" : "VII",
  "Hobbies" : "Internet Surfing"
}

{
  "_id" : 2,
  "StudName" : "Mabel Mathews",
  "Grade" : "VII",
  "Hobbies" : "Baseball"
}

{
  "_id" : 3,
  "Grade" : "VII",
  "StudName" : "Aryan David",
  "Hobbies" : "Skating"
}
```

Act:

```
db.Students.update({_id:3, StudName:"Aryan David", Grade: "VII"},{$set:{Hobbies: "Chess"}}, {upsert:true});
```

```
C:\Windows\system32\cmd.exe - mongo
> db.Students.update({_id:3, StudName:"Aryan David", Grade: "VII"},{$set:{Hobbies: "Chess"}}, {upsert:true});
writeResult({ "nMatched" : 1, "nUpserted" : 0, "nModified" : 1 })
```

Outcome: Confirm that the required changes have been made to the document of “Aryan David” in the “Students” collection.

```
C:\Windows\system32\cmd.exe - mongo
> db.Students.find({_id:3});
{
  "_id" : 3,
  "Grade" : "VII",
  "StudName" : "Aryan David",
  "Hobbies" : "Chess"
}
```

Objective: To demonstrate Save method to insert a document for student “Vamsi Bapat” in the “Students” collection. Omit providing value for the _id key.

Input: Check the documents in the “Students” collection before proceeding.

```
C:\Windows\system32\cmd.exe - mongo
> db.Students.find().pretty();
{
  "_id" : 1,
  "StudName" : "Michelle Jacintha",
  "Grade" : "VII",
  "Hobbies" : "Internet Surfing"
}

{
  "_id" : 2,
  "StudName" : "Mabel Mathews",
  "Grade" : "VII",
  "Hobbies" : "Baseball"
}

{
  "Grade" : "VII",
  "StudName" : "Aryan David",
  "Hobbies" : "Chess"
}
```

Act:

```
db.Students.save({StudName:"Vamsi Bapat",Grade:"VI"})
```

```
Windows\system32\cmd.exe - mongo
> db.Students.save({StudName:"Vamsi Bapat",Grade:"VI"})
writeResult({ "nInserted" : 1 })
```

Outcome: Confirm the presence of the document of “Vamsi Bapat” in the “Students” collection.

```
Windows\system32\cmd.exe - mongo
db.Students.find().pretty();
{
  "_id" : 1,
  "StudName" : "Michelle Jacintha",
  "Grade" : "VII",
  "Hobbies" : "Internet Surfing"

  "_id" : 2,
  "StudName" : "Mabel Mathews",
  "Grade" : "VII",
  "Hobbies" : "Baseball"

  "_id" : 3,
  "Grade" : "VII",
  "StudName" : "Aryan David",
  "Hobbies" : "Chess"

  "_id" : ObjectId("546dd0e0a7fba710799bb94d"),
  "StudName" : "Vamsi Bapat",
  "Grade" : "VI"
}
```

4.5.2 Save() Method

We now explain the save() method. The save() method will insert a new document if the document with the specified _id does not exist. However, if a document with the specified id exists, it replaces the existing document with the new one.

Objective: Insert the document of “Hersch Gibbs” into the Students collection using the Update method. First try with upsert set to false and then with upsert set to true.

Input: Check the documents in the “Students” collection before proceeding.

```
Windows\system32\cmd.exe - mongo
db.Students.find();
{
  "_id" : 1,
  "StudName" : "Michelle Jacintha",
  "Grade" : "VII",
  "Hobbies" : "Internet Surfing"
}
{
  "_id" : 2,
  "StudName" : "Mabel Mathews",
  "Grade" : "VII",
  "Hobbies" : "Baseball"
}
{
  "_id" : 3,
  "Grade" : "VII",
  "StudName" : "Aryan David",
  "Hobbies" : "Chess"
}
{
  "_id" : ObjectId("546dd0e0a7fba710799bb94d"),
  "StudName" : "Vamsi Bapat",
  "Grade" : "VI"
}
```

Act: Update method with upsert set to false.

```
db.Students.update({_id:4, StudName:"Hersch Gibbs", Grade: "VII"},{$set:{Hobbies: "Graffiti"}}, {upsert:false});
```

```
Windows\system32\cmd.exe - mongo
> db.Students.update({_id:4, StudName:"Hersch Gibbs", Grade: "VII"},{$set:{Hobbies: "Graffiti"}}, {upsert:false});
writeResult({ "nMatched" : 0, "nUpserted" : 0, "nModified" : 0 })
```

As evident from the above display (nUpserted : 0), no document has been inserted because upsert is set to false.

Update method with upsert set to true.

```
db.Students.update({_id:4, StudName:"Hersch Gibbs", Grade: "VII"}, {$set:{Hobbies: "Graffiti"}}, {upsert:true});
```

```
> db.Students.update({_id:4, StudName:"Hersch Gibbs", Grade: "VII"}, {$set:{Hobbies: "Graffiti"}}, {upsert:true});
> writeResult({ "nMatched" : 0, "nUpserted" : 1, "nModified" : 0, "_id" : 4 })
```

nUpserted: 1 implies that a document with _id:4 has been inserted.

Outcome: Confirm the presence of the document of “Hersch Gibbs” in the “Students” collection.

```
> db.Students.find();
{ "_id" : 1, "StudName" : "Michelle Jacintha", "Grade" : "VII", "Hobbies" : "Internet Surfing" }
{ "_id" : 2, "StudName" : "Mabel Mathews", "Grade" : "VI", "Hobbies" : "Baseball" }
{ "_id" : 3, "Grade" : "VII", "StudName" : "Aryan David", "Hobbies" : "Chess" }
{ "_id" : ObjectId("546dd0e0a7fba710799bb94d"), "StudName" : "Vamsi Bapat", "Grade" : "VI" }
{ "_id" : 4, "Grade" : "VII", "StudName" : "Hersch Gibbs", "Hobbies" : "Graffiti" }
```

6.5.3 Adding a New Field to an Existing Document – Update Method

We now discuss the syntax of update method.

```
db.students.update( {Age: {$gt 18}}, {$set: {Status: "A"}}, {multi:true} )
```

← Collection	← Update Criteria
← Update Action	← Update Option

Objective: To add a new field “Location” with value “Newark” to the document (_id:4) of “Students” collection.

Input: Check the document (_id:4) in the “Students” collection before proceeding.

```
> db.Students.find({_id:4}).pretty();
{
  "_id" : 4,
  "Grade" : "VII",
  "StudName" : "Hersch Gibbs",
  "Hobbies" : "Graffiti"
}
```

Act:

```
db.Students.update({_id:4},{$set:{Location:"Newark"}},);
```

```
> db.Students.update({_id:4},{$set:{Location:"Newark"}});
> writeResult({ "nMatched" : 1, "nUpserted" : 0, "nModified" : 1 })
```

Outcome: Confirm that the new field “Location” with value “Newark” has been added to document (_id:4) in the “Students” collection.

```
> db.Students.find({_id:4}).pretty();
{
  "_id" : 4,
  "Grade" : "VII",
  "StudName" : "Hersch Gibbs",
  "Hobbies" : "Graffiti",
  "Location" : "Newark"
}
```

6.5.4 Removing an Existing Field from an Existing Document – Remove Method

In this section we will explain the syntax of remove method.

```
db.students.remove( ← Collection
  {Age: {$gt 18}}, ← Remove Criteria
)
```

Objective: To remove the field “Location” with value “Newark” in the document (_id:4) of “Students” collection.

Input: Check the document (_id:4) in the “Students” collection before proceeding.

```
Windows\system32\cmd.exe - mongo
> db.Students.find({_id:4}).pretty();
{
  "_id" : 4,
  "Grade" : "VII",
  "StudName" : "Hersch Gibbs",
  "Hobbies" : "Graffiti",
  "Location" : "Newark"
}
```

Act:

```
db.Students.update({_id:4},{$unset:{Location:"Newark"});
```

```
Windows\system32\cmd.exe - mongo
> db.Students.update({_id:4},{$unset:{Location:"Newark"}});
> writeResult({ "nMatched" : 1, "nUpserted" : 0, "nModified" : 1 })
```

Outcome: Confirm if the stated field (“Location”) has been dropped from the document (_id:4) of the “Students” collection.

```
Windows\system32\cmd.exe - mongo
> db.Students.find({_id:4}).pretty();
{
  "_id" : 4,
  "Grade" : "VII",
  "StudName" : "Hersch Gibbs",
  "Hobbies" : "Graffiti"
}
```

6.5.5 Finding Documents based on Search Criteria – Find Method

The syntax of find method is as follows:

```
db.students.find( ← Collection
  {Age: {$gt 18}}, ← Selection Criteria
  {RollNo:1,Age:1,_id:1} ← Projection
).limit(10) ← Cursor Modifier
```

Objective: To search for documents from the “Students” collection based on certain search criteria.

Input: Check the documents in the “Students” collection before proceeding.

```
C:\Windows\system32\cmd.exe - mongo
> db.Students.find({}).pretty();
{
  "_id" : 1,
  "StudName" : "Michelle Jacintha",
  "Grade" : "VII",
  "Hobbies" : "Internet Surfing"
}
{
  "_id" : 3,
  "Grade" : "VII",
  "StudName" : "Aryan David",
  "Hobbies" : "Chess"
}
{
  "_id" : 4,
  "Grade" : "VII",
  "StudName" : "Hersch Gibbs",
  "Hobbies" : "Graffiti"
}
{
  "_id" : ObjectId("5464849889adlab07d489b7f"),
  "StudName" : "Vamsi Bapat",
  "Grade" : "VI"
}
{
  "_id" : 2,
  "StudName" : "Mabel Mathews",
  "Grade" : "VII",
  "Hobbies" : "Baseball"
}
```

Act: Find the document wherein the "StudName" has value "Aryan David".

```
db.Students.find({StudName:"Aryan David"});
```

Outcome:

```
C:\Windows\system32\cmd.exe - mongo
> db.Students.find({StudName:"Aryan David"});
{ "_id" : 3, "Grade" : "VII", "StudName" : "Aryan David", "Hobbies" : "Chess" }
```

To format the above output, use the pretty() method:

```
db.Students.find({StudName:"Aryan David"}).pretty();
```

```
C:\Windows\system32\cmd.exe - mongo
> db.Students.find({StudName:"Aryan David"}).pretty();
{
  "_id" : 3,
  "Grade" : "VII",
  "StudName" : "Aryan David",
  "Hobbies" : "Chess"
}
```

RDBMS equivalent:

Select *

From Students

Where StudName like 'Aryan David';

```
SQL> select * from Students where StudName like 'Aryan David';
STUDR STUDNAME          GRADE HOBBIES
----- -----
3      Aryan David        VII   Chess
SQL>
```

Objective: To display only the StudName from all the documents of the Student's collection. The identifier "__id" should be suppressed and NOT displayed.

Act:

```
db.Students.find({}, {StudName:1, _id:0});
```

Outcome:

```
C:\Windows\system32\cmd.exe - mongo
> db.Students.find({}, {StudName:1, _id:0});
"StudName" : "Michelle Jacintha"
"StudName" : "Aryan David"
"StudName" : "Hersch Gibbs"
"StudName" : "Vamsi Bapat"
"StudName" : "Mabel Mathews"
```

RDBMS equivalent:

Select StudName
From Students;

```
SQL> select StudName from Students;
STUDNAME
-----
Michelle Jacintha
Aryan David
Mabel Mathews
Hersch Gibbs
Vamsi Bapat
SQL>
```

Objective: To display only the StudName and Grade from all the documents of the Students collection. The identifier _id should be suppressed and NOT displayed.

Act:

```
db.Students.find({}, {StudName:1, Grade:1, _id:0});
```

Outcome:

```
C:\Windows\system32\cmd.exe - mongo
> db.Students.find({}, {StudName:1, Grade:1, _id:0});
"StudName" : "Michelle Jacintha", "Grade" : "VII"
"StudName" : "Aryan David", "Grade" : "VII"
"StudName" : "Hersch Gibbs", "Grade" : "VII"
"StudName" : "Vamsi Bapat", "Grade" : "VI"
"StudName" : "Mabel Mathews", "Grade" : "VII"
```

RDBMS equivalent:

Select StudName, Grade
From Students;

```
SQL> select StudName, Grade from Students;
STUDNAME          GRADE
-----
Michelle Jacintha    VII
Aryan David        VII
Mabel Mathews      VII
Hersch Gibbs       VII
Vamsi Bapat        VI
SQL>
```

Objective: To display the StudName, Grade as well the identifier, _id from the document of the Students collection where the _id column is 1.

Act:

```
db.Students.find({_id:1}, {StudName:1, Grade:1});
```

Outcome:

```
C:\Windows\system32\cmd.exe - mongo
> db.Students.find({_id:1},{StudName:1,Grade:1});
{ "_id" : 1, "StudName" : "Michelle Jacintha", "Grade" : "VII" }
```

RDBMS equivalent:

Select StudRollNo, StudName, Grade

From Students

Where StudRollNo = '1';

```
SQL>
SQL> select StudRollNo, StudName, Grade from Students where StudRollNo = '1';
STUDR STUDNAME          GRADE
----- -----
1      Michelle Jacintha    VII
SQL>
```

Objective: To display the StudName and Grade from the document of the Students collection where the _id column is 1. The _id field should NOT be displayed.

Act:

```
db.Students.find({_id:1},{StudName:1,Grade:1,_id:0});
```

Outcome:

```
C:\Windows\system32\cmd.exe - mongo
> db.Students.find({_id:1},{StudName:1,Grade:1,_id:0});
{ "StudName" : "Michelle Jacintha", "Grade" : "VII" }
```

RDBMS equivalent:

Select StudName, Grade

From Students

Where StudRollNo like '1';

```
SQL>
SQL> select StudName, Grade from Students where StudRollNo like '1';
STUDNAME          GRADE
----- -----
Michelle Jacintha    VII
SQL>
```

Relational operators available to use in the search criteria:

\$eq	→ equal to
\$ne	→ not equal to
\$gte	→ greater than or equal to
\$lte	→ less than or equal to
\$gt	→ greater than
\$lt	→ less than

Objective: To find those documents where the Grade is set to 'VII'.

Act:

```
db.Students.find({Grade:{$eq:'VII'}}).pretty();
```

Outcome:

```
C:\Windows\system32\cmd.exe - mongo
> db.Students.find({Grade:{'$eq':'VII'}}).pretty();
{
    "_id" : 1,
    "StudName" : "Michelle Jacintha",
    "Grade" : "VII",
    "Hobbies" : "Internet Surfing"
}

{
    "_id" : 3,
    "Grade" : "VII",
    "StudName" : "Aryan David",
    "Hobbies" : "Chess"
}

{
    "_id" : 4,
    "Grade" : "VII",
    "StudName" : "Hersch Gibbs",
    "Hobbies" : "Graffiti"
}

{
    "_id" : 2,
    "StudName" : "Mabel Mathews",
    "Grade" : "VII",
    "Hobbies" : "Baseball"
}
```

RDBMS Equivalent:

Select *

From Students

Where Grade like 'VII';

```
SQL> select * from Students where Grade like 'VII';
STUDR STUDNAME          GRADE HOBBIES
----- -----
1  Michelle Jacintha    VII   Internet surfing
3  Aryan David          VII   Chess
2  Mabel Mathews        VII   Baseball
4  Hersch Gibbs         VII   Graffiti
SQL>
```

Objective: To find those documents where the Grade is NOT set to 'VII'.

Act:

db.Students.find({Grade:{'\$ne':'VII'}}).pretty();

Outcome:

```
C:\Windows\system32\cmd.exe - mongo
> db.Students.find({Grade:{'$ne':'VII'}}).pretty();
{
    "_id" : ObjectId("5464849889ad1ab07d489b7f"),
    "StudName" : "Vamsi Bapat",
    "Grade" : "VI"
}
```

There is just one document that meets the above criteria of Grade NOT EQUAL to 'VII'.

RDBMS Equivalent:

Select *

From Students

Where Grade <> 'VII';

```
SQL> select * from Students where Grade <> 'VII';
STUDR STUDNAME          GRADE HOBBIES
----- -----
Vamsi Bapat              VI
SQL>
```

OR

```
SQL> select * from Students where Grade != 'VII';
STUDR STUDNAME          GRADE HOBBIES
----- -----
  3 Vamsi Bapat           VI

SQL>
```

Objective: To find those documents from the Students collection where the Hobbies is set to either 'Chess' or is set to 'Skating'.

Act:

```
db.Students.find ({Hobbies :{ $in: ['Chess','Skating']} }).pretty ()
```

Outcome:

```
> db.Students.find ({Hobbies :{ $in: ['Chess','Skating']} }).pretty ();
{
  "_id" : 3,
  "Grade" : "VII",
  "Studname" : "Aryan David",
  "Hobbies" : "Chess"
}
```

RDBMS Equivalent:

Select *

From Students

Where Hobbies in ('Chess', 'Skating');

```
SQL> select * from Students where Hobbies in ('Chess', 'Skating');
STUDR STUDNAME          GRADE HOBBIES
----- -----
  3 Aryan David           VII   Chess

SQL>
```

Objective: To find those documents from the Students collection where the Hobbies is set neither to 'Chess' nor is set to 'Skating'.

Act:

```
db.Students.find ({Hobbies :{ $nin: ['Chess','Skating']} }).pretty ()
```

Outcome:

```
> db.Students.find ({Hobbies :{ $nin: ['Chess','Skating']} }).pretty ();
{
  "_id" : 1,

SQL>
```

6.5.6 Dealing with NULL Values

Objective: To add a new field with null value in existing documents (_id:3 and _id:4) of Students collection. A NULL is a missing or unknown value. When we place NULL as a value for a field, it implies that currently we do not know the value or the value is missing. We can always update the value of the field once we know it.

Input: Before we execute the commands to update documents with a null value in a column, let us first view the two documents.

```
db.Students.find({$or:[{_id:3},{_id:4}]})
```

```
C:\Windows\system32\cmd.exe - mongo
> db.Students.find({$or:[{_id:3},{_id:4}]});
{
  "_id" : 3, "Grade" : "VII", "StudName" : "Aryan David", "Hobbies" : "Chess" }
{
  "_id" : 4, "Grade" : "VII", "StudName" : "Hersch Gibbs", "Hobbies" : "Graffiti" }
```

Act: Update the documents with NULL values in the "Location" column.

```
db.Students.update({_id:3},{$set:{Location:null}});
db.Students.update({_id:4},{$set:{Location:null}});
```

```
C:\Windows\system32\cmd.exe - mongo
> db.Students.update({_id:3},{$set:{Location:null}});
writeResult({ "nMatched" : 1, "nUpserted" : 0, "nModified" : 1 })
> db.Students.update({_id:4},{$set:{Location:null}});
writeResult({ "nMatched" : 1, "nUpserted" : 0, "nModified" : 1 })
```

RDBMS Equivalent:

Update Students

Set Location = null

Where StudRollNo in ('3','4');

```
SQL> update Students set Location = null where StudRollNo in ('3','4');
2 rows updated.
SQL>
```

Outcome: To search for NULL values in Location column.`db.Students.find({Location:{$eq:null}});`

```
SQL> db.Students.find({Location:{$eq:null}});
{
  "_id" : 1, "StudName" : "Michelle Jacintha", "Grade" : "VII", "Hobbies" : "Internet Surfing" ,
  "_id" : 3, "Grade" : "VII", "StudName" : "Aryan David", "Hobbies" : "Chess", "Location" : null ,
  "_id" : 4, "Grade" : "VII", "StudName" : "Hersch Gibbs", "Hobbies" : "Graffiti", "Location" : null ,
  "_id" : ObjectId("5464849889adlab07d489b7f"), "StudName" : "Vamsi Bapat", "Grade" : "VI" ,
  "_id" : 2, "StudName" : "Mabel Mathews", "Grade" : "VII", "Hobbies" : "Baseball" }
```

The above statement displays documents which either have NULL values in the location column or do not have the location column at all.

RDBMS Equivalent:

Select *

From Students

Where Location is Null;

```
SQL> select * from Students where Location is NULL;
STUDR STUDNAME          GRADE HOBIES           LOCATION
----- -----
1    Michelle Jacintha    VII   Internet surfing
2    Aryan David          VII   Chess
3    Mabel Mathews        VII   Baseball
4    Hersch Gibbs         VII   Graffiti
5    Vamsi Bapat          VI    
```

Objective: To remove “Location” field having “NULL” values from the documents (_id:3 and _id:4) from the Students collection.**Input:** Document from the “Students” collection having “NULL” values in the “Location” column.

```
SQL> db.Students.find({Location:{$eq:null}});
{
  "_id" : 1, "StudName" : "Michelle Jacintha", "Grade" : "VII", "Hobbies" : "Internet Surfing" ,
  "_id" : 3, "Grade" : "VII", "StudName" : "Aryan David", "Hobbies" : "Chess", "Location" : null ,
  "_id" : 4, "Grade" : "VII", "StudName" : "Hersch Gibbs", "Hobbies" : "Graffiti", "Location" : null ,
  "_id" : ObjectId("5464849889adlab07d489b7f"), "StudName" : "Vamsi Bapat", "Grade" : "VI" ,
  "_id" : 2, "StudName" : "Mabel Mathews", "Grade" : "VII", "Hobbies" : "Baseball" }
```

Act:

```
db.Students.update({_id:3},{$unset:{Location:null}});
db.Students.update({_id:4},{$unset:{Location:null}});
```

```
SQL> db.Students.update({_id:3},{$unset:{Location:null}});
WriteResult({ "nMatched" : 1, "nUpserted" : 0, "nModified" : 0 })
SQL> db.Students.update({_id:4},{$unset:{Location:null}});
WriteResult({ "nMatched" : 1, "nUpserted" : 0, "nModified" : 0 })
```

- Outcome:** Let us confirm if the changes have been made by running find method on the Students collection.

```
C:\Windows\system32\cmd.exe - mongo
> db.Students.find({})
  "_id" : 1, "StudName" : "Michelle Jacintha", "Grade" : "VII", "Hobbies" : "Internet Surfing"
  "_id" : 3, "Grade" : "VII", "StudName" : "Aryan David", "Hobbies" : "Chess"
  "_id" : 4, "Grade" : "VII", "StudName" : "Hersch Gibbs", "Hobbies" : "Graffiti"
  "_id" : ObjectId("5464849889ad1ab07d489b7f"), "StudName" : "Vamini Rapti",
```

6.5.7 Count, Limit, Sort, and Skip

- Objective:** To find the number of documents in the Students collection.

Act:

```
db.Students.count()
```

Outcome:

```
C:\Windows\system32\cmd.exe - mongo
> db.Students.count()
5
```

- Objective:** To find the number of documents in the Students collection wherein the Grade is VII.

Act:

```
db.Students.count({Grade:"VII"});
```

Outcome:

```
C:\Windows\system32\cmd.exe - mongo
> db.Students.count({Grade:"VII"});
4
```

- Objective:** To retrieve the first 3 documents from the Students collection wherein the Grade is VII.

Act:

```
db.Students.find({Grade:"VII"}).limit(3).pretty();
```

Outcome:

```
C:\Windows\system32\cmd.exe - mongo
> db.Students.find({Grade:"VII"}).limit(3).pretty();
[{
  "_id" : 1,
  "StudName" : "Michelle Jacintha",
  "Grade" : "VII",
  "Hobbies" : "Internet Surfing"
},
{
  "_id" : 3,
  "Grade" : "VII",

6.5.8 Arrays

Objective: To create a collection by the name “food” and then insert documents into the “food” collection. Each document should have a “fruits” array.

Act:

```
db.food.insert({_id:1,fruits:[ 'banana','apple','cherry' ] })
db.food.insert({_id:2,fruits:[ 'orange','butterfruit','mango' ]})
db.food.insert({_id:3,fruits:[ 'pineapple','strawberry','grapes' ]});
db.food.insert({_id:4,fruits:[ 'banana','strawberry','grapes' ]});
db.food.insert({_id:5,fruits:[ 'orange','grapes' ]});
```

```
> db.food.insert({_id:1,fruits:[ "banana","apple","cherry" ] })
WriteResult({ "nInserted" : 1 })
> db.food.insert({_id:2,fruits:[ "orange","butterfruit","mango" ]})
WriteResult({ "nInserted" : 1 })
> db.food.insert({_id:3,fruits:[ "pineapple","strawberry","grapes" ]})
WriteResult({ "nInserted" : 1 })
> db.food.insert({_id:4,fruits:[ "banana","strawberry","grapes" ]})
WriteResult({ "nInserted" : 1 })
> db.food.insert({_id:5,fruits:[ "orange","grapes" ]})
WriteResult({ "nInserted" : 1 })
```

Outcome: Let us check if these documents are now in the “food” collection.

```
db.food.find({})
```

```
> db.food.find({})
[{"_id": 1, "fruits": [ "banana", "apple", "cherry" ]},
 {"_id": 2, "fruits": [ "orange", "butterfruit", "mango" ]},
 {"_id": 3, "fruits": [ "pineapple", "strawberry", "grapes" ]},
 {"_id": 4, "fruits": [ "banana", "strawberry", "grapes" ]},
 {"_id": 5, "fruits": [ "orange", "grapes" ]}]
```

Objective: To find those documents from the “food” collection which has the “fruits array” constituted of “banana”, “apple” and “cherry”.

Act:

```
db.food.find({fruits:['banana','apple','cherry']}).pretty()
```

Outcome:

```
> db.food.find({fruits:[ "banana", "apple", "cherry" ]}).pretty()
[{"_id": 1, "fruits": [ "banana", "apple", "cherry" ]}]
```

Objective: To find those documents from the “food” collection which has the “fruits” array having “banana”, as an element.

Act:

```
db.food.find({fruits:'banana'})
```

Outcome:

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find({fruits:'banana'})
{ "_id" : 1, "fruits" : [ "banana", "apple", "cherry" ] }
{ "_id" : 4, "fruits" : [ "banana", "strawberry", "grapes" ] }
```

Objective: To find those documents from the “food” collection which have the “fruits” array having “grapes” in the first index position. The index position begins at 0.

Act:

```
db.food.find({'fruits.1':'grapes'})
```

Outcome:

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find({'fruits.1':'grapes'})
{ "_id" : 5, "fruits" : [ "orange", "grapes" ] }
```

Objective: To find those documents from the “food” collection where “grapes” is present in the 2nd index position of the “fruits” array.

Act:

```
db.food.find({'fruits.2':'grapes'})
```

Outcome:

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find({'fruits.2':'grapes'})
{ "_id" : 3, "fruits" : [ "pineapple", "strawberry", "grapes" ] }
{ "_id" : 4, "fruits" : [ "banana", "strawberry", "grapes" ] }
```

Objective: To find those documents from the “food” collection where the size of the array is two. The size implies that the array holds only 2 values.

Act:

```
db.food.find({"fruits":{$size:2}})
```

Outcome:

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find({"fruits":{$size:2}})
{ "_id" : 5, "fruits" : [ "orange", "grapes" ] }
```

Objective: To find those documents from the “food” collection where the size of the array is three. The size implies that the array holds only 3 values.

Act:

```
db.food.find({"fruits":{$size:3}})
```

Outcome:

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find({"fruits":{$size:3}});
{ "_id" : 1, "fruits" : [ "banana", "apple", "cherry" ] }
{ "_id" : 2, "fruits" : [ "orange", "butterfruit", "mango" ] }
{ "_id" : 3, "fruits" : [ "pineapple", "strawberry", "grapes" ] }
{ "_id" : 4, "fruits" : [ "banana", "strawberry", "grapes" ] }
```

Objective: To find the document with (_id: 1) from the “food” collection and display the first two elements from the array “fruits”.

Act:

```
db.food.find({_id:1}, {"fruits":{$slice:2}})
```

Outcome:

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find({_id:1}, {"fruits":{$slice:2}});
{ "_id" : 1, "fruits" : [ "banana", "apple" ] }
```

Objective: To find all documents from the “food” collection which have elements “orange” and “grapes” in the array “fruits”.

Act:

```
db.food.find ({fruits: {$all: ["orange", "grapes"]}}).pretty();
```

Outcome:

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find ({fruits: {$all: ["orange", "grapes"]}}).pretty();
{ "_id" : 5, "fruits" : [ "orange", "grapes" ] }
```

Objective: To find those documents from the “food” collection which have the element “orange” in the 0th index position in the array “fruits”.

Act:

```
db.food.find({ "fruits.0" : "orange" }).pretty();
```

Outcome:

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find({ "fruits.0" : "orange" }).pretty();
{ "_id" : 2, "fruits" : [ "orange", "butterfruit", "mango" ] }
{ "_id" : 5, "fruits" : [ "orange", "grapes" ] }
```

Objective: To find the document with (_id: 1) from the “food” collection and display two elements from the array “fruits”, starting with the element at 0th index position.

Act:

```
db.food.find({_id:1}, {"fruits":{$slice:[0,2]}})
```

Outcome:

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find({_id:1}, {"fruits":{$slice:[0,2]}})
[{"_id" : 1, "fruits" : [ "banana", "apple" ] }
```

Objective: To find the document with (_id: 1) from the “food” collection and display two elements from the array “fruits”, starting with the element at 1st index position.

Act:

```
db.food.find({_id:1}, {"fruits":{$slice:[1,2]}})
```

Outcome:

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find({_id:1}, {"fruits":{$slice:[1,2]}})
[{"_id" : 1, "fruits" : [ "apple", "cherry" ] }
```

Objective: To find the document with (_id: 1) from the “food” collection and display three elements from the array “fruits”, starting with the element at 2nd index position. Since we have only 3 elements in the array “fruits” for the document with _id:1, it displays only one element, the element at 2nd index position, that is, “cherry”.

Act:

```
db.food.find({_id:1}, {"fruits":{$slice:[2,3]}})
```

Outcome:

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find({_id:1}, {"fruits":{$slice:[2,3]}})
[{"_id" : 1, "fruits" : [ "cherry" ] }
```

6.5.8.1 Update on the Array

Before we begin the update operations on the “fruits” array of the documents of “food” collection, let us take a look at the documents that we have in the “food” collection:

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find({})
[{"_id" : 1, "fruits" : [ "banana", "apple", "cherry" ] },
 {"_id" : 2, "fruits" : [ "orange", "butterfruit", "mango" ] },
 {"_id" : 3, "fruits" : [ "pineapple", "strawberry", "grapes" ] },
 {"_id" : 4, "fruits" : [ "banana", "strawberry", "grapes" ] },
 {"_id" : 5, "fruits" : [ "orange", "grapes" ] }]
```

Objective: To update the document with “_id:4” and replace the element present in the 1st index position of the “fruits” array with “apple”.

Act:

```
db.food.update({_id:4},{$set:{'fruits.1': 'apple'})
```

```
C:\Windows\system32\cmd.exe - mongo
> db.food.update({_id:4},{$set:{'fruits.1': 'apple'})}
writeResult({ "nMatched" : 1, "nUpserted" : 0, "nModified" : 1 })
```

Outcome: Let us take a look at how this update has changed our document.

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find({_id:4});
{ "_id" : 4, "fruits" : [ "banana", "apple", "grapes" ] }
```

Objective: To update the document with “_id:1” and replace the element “apple” of the “fruits” array with “An apple”.

Act:

```
db.food.update({_id:1,'fruits':'apple'},{$set:{'fruits.$': 'An apple' }})
```

```
C:\Windows\system32\cmd.exe - mongo
> db.food.update({_id:1,'fruits':'apple'},{$set:{'fruits.$': 'An apple' }})
writeResult({ "nMatched" : 1, "nUpserted" : 0, "nModified" : 1 })
```

Outcome: The document after update is as follows.

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find({_id:1});
{ "_id" : 1, "fruits" : [ "banana", "An apple", "cherry" ] }
```

Objective: To update the document with “_id:2” and push new key value pairs in the “fruits” array.

Act:

```
db.food.update({_id:2},{$push:{price:{orange:60,butterfruit:200,mango:120}}})
```

```
C:\Windows\system32\cmd.exe - mongo
> db.food.update({_id:2},{$push:{price:{orange:60,butterfruit:200,mango:120}}})
writeResult({ "nMatched" : 1, "nUpserted" : 0, "nModified" : 1 })
```

Outcome:

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find().pretty();
{
  "_id" : 1,
  "fruits" : [
    "banana",
    "An apple",
    "cherry"
  ],
  "price" : [
    {
      "orange" : 60,
      "butterfruit" : 200,
      "mango" : 120
    }
  ]
}

{
  "_id" : 2,
  "fruits" : [
    "orange",
    "butterfruit",
    "mango"
  ],
  "price" : [
    {
      "orange" : 60,
      "butterfruit" : 200,
      "mango" : 120
    }
  ]
}
```

6.5.8.2 Further Updates to the Array "fruits" ...

Before we do the updates to the documents in the food collection, let us look at the current state:

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find().pretty();
{
  "_id" : 1,
  "fruits" : [
    "banana",
    "An apple",
    "cherry"
  ]
}
{
  "_id" : 3,
  "fruits" : [
    "pineapple",
    "strawberry",
    "grapes"
  ]
}
{
  "_id" : 4,
  "fruits" : [
    "banana",
    "apple",
    "grapes"
  ]
}
{
  "_id" : 5,
  "fruits" : [
    "orange",
    "grapes"
  ]
}

{
  "_id" : 2,
  "Fruits" : [
    "orange",
    "butterfruit",
    "mango"
  ],
  "price" : [
    {
      "orange" : 60,
      "butterfruit" : 200,
      "mango" : 120
    }
  ]
}
```

Objective: To update the document with “_id:4” by adding an element “orange” to the list of elements in the array “fruits”.

Act:

```
db.food.update({_id:4},{$addToSet:{fruits:"orange"});
```

```
C:\Windows\system32\cmd.exe - mongo
> db.food.update({_id:4},{$addToSet:{fruits:"orange"}});
writeResult({ "nMatched" : 1, "nUpserted" : 0, "nModified" : 1 })
```

Outcome: The result after the execution of the statement is as follows.

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find().pretty();
{
  "_id" : 1,
  "fruits" : [
    "banana",
    "An apple",
    "cherry"
  ]
}
{
  "_id" : 3,
  "fruits" : [
    "pineapple",
    "strawberry",
    "grapes"
  ]
}
{
  "_id" : 4,
  "fruits" : [
    "banana",
    "apple",
    "grapes",
    "orange"
  ]
}
{
  "_id" : 5,
  "fruits" : [
    "orange",
    "grapes"
  ]
}

{
  "_id" : 2,
  "Fruits" : [
    "orange",
    "butterfruit",
    "mango"
  ],
  "price" : [
    {
      "orange" : 60,
      "butterfruit" : 200,
      "mango" : 120
    }
  ]
}
```

Objective: To update the document with “_id:4” by popping an element from the list of elements present in the array “fruits”. The element popped is the one from the end of the array.

Act:

```
db.food.update({_id:4},{$pop:{fruits:1}});
```

```
C:\Windows\system32\cmd.exe - mongo
> db.food.update({_id:4},{$pop:{fruits:1}});
writeResult({ "nMatched" : 1, "nUpserted" : 0, "nModified" : 1 })
```

Outcome: The “food” collection after the execution of the statement is as follows.

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find().pretty();
{
  "_id" : 1,
  "fruits" : [
    "banana",
    "An apple",
    "cherry"
  ]
}
{
  "_id" : 3,
  "fruits" : [
    "pineapple",
    "strawberry",
    "grapes"
  ]
}
{
  "_id" : 4,
  "fruits" : [
    "banana",
    "apple",
    "grapes"
  ]
}
{
  "_id" : 5,
  "fruits" : [
    "orange",
    "grapes"
  ]
}
{
  "_id" : 2,
  "fruits" : [
    "orange",
    "butterfruit",
    "mango"
  ],
  "price" : [
    {
      "orange" : 60,
      "butterfruit" : 200,
      "mango" : 120
    }
  ]
}
```

Objective: To update the document with “_id:4” by popping an element from the list of elements present in the array “fruits”. The element popped is the one from the beginning of the array.

Act:

```
db.food.update({ _id:4 }, { $pop:{fruits:-1}});
```

```
C:\Windows\system32\cmd.exe - mongo
> db.food.update({ _id:4 }, { $pop:{fruits:-1}});
WriteResult({ "nMatched" : 1, "nUpserted" : 0, "nModified" : 1 })
>
```

Outcome: The “food” collection after the execution of the above update statement is as follows.

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find().pretty();
{
  "_id" : 1,
  "fruits" : [
    "banana",
    "An apple",
    "cherry"
  ]
}
{
  "_id" : 3,
  "fruits" : [
    "pineapple",
    "strawberry",
    "grapes"
  ]
}
{
  "_id" : 4,
  "fruits" : [
    "apple",
    "grapes"
  ]
}
{
  "_id" : 5,
  "fruits" : [
    "orange",
    "grapes"
  ]
}
{
  "_id" : 2,
  "fruits" : [
    "orange",
    "butterfruit",
    "mango"
  ],
  "price" : [
    {
      "orange" : 60,
      "butterfruit" : 200,
      "mango" : 120
    }
  ]
}
```

Objective: To update the document with “_id:3” by popping two elements from the list of elements present in the array “fruits”. The elements popped are “pineapple” and “grapes”.

The document with “_id:3” before the update is

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find({ _id:3 });
{
  "_id" : 3,
  "fruits" : [
    "pineapple",
    "strawberry",
    "grapes"
  ]
}
```

Act:

```
db.food.update({_id:3},{$pullAll:{fruits: [ 'pineapple','grapes' ]}});
```

```
C:\Windows\system32\cmd.exe - mongo
> db.food.update({_id:3},{$pullAll:{fruits: [ 'pineapple','grapes' ]}});
writeResult({ "nMatched" : 1, "nUpserted" : 0, "nModified" : 1 })
```

Outcome: The document with “_id:3” after the update is as follows:

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find({_id:4});
{ "_id" : 4, "fruits" : [ "apple", "grapes" ] }
```

Objective: To update the documents having “banana” as an element in the array “fruits” and pop out the element “banana” from those documents.

The “food” collection before the update is as follows:

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find().pretty();
{
  "_id" : 1,
  "fruits" : [
    "banana",
    "An apple",
    "cherry"
  ]
}
{
  "_id" : 3,
  "fruits" : [
    "strawberry"
  ]
}
{
  "_id" : 4,
  "fruits" : [
    "apple",
    "grapes"
  ]
}
{
  "_id" : 5,
  "fruits" : [
    "orange",
    "grapes"
  ]
}

{
  "_id" : 2,
  "fruits" : [
    "orange",
    "butterfruit",
    "mango"
  ],
  "price" : [
    {
      "orange" : 60,
      "butterfruit" : 200,
      "mango" : 120
    }
  ]
}
```

Act:

```
db.food.update({fruits:'banana'}, {$pull:{fruits:'banana'}})
```

```
C:\Windows\system32\cmd.exe - mongo
> db.food.update({fruits:'banana'}, {$pull:{fruits:'banana'}});
writeResult({ "nMatched" : 1, "nUpserted" : 0, "nModified" : 1 })
```

Outcome: The “food” collection after the update is as follows:

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find().pretty();
{
  "_id" : 1,
  "fruits" : [
    "An apple",
    "cherry"
  ]
}
{
  "_id" : 3,
  "fruits" : [
    "strawberry"
  ]
}
{
  "_id" : 4,
  "fruits" : [
    "apple",
    "grapes"
  ]
}
{
  "_id" : 5,
  "fruits" : [
    "orange",
    "grapes"
  ]
}

{
  "_id" : 2,
  "fruits" : [
    "orange",
    "butterfruit",
    "mango"
  ],
  "price" : [
    {
      "orange" : 60,
      "butterfruit" : 200,
      "mango" : 120
    }
  ]
}
```

Objective: To pull out an array element based on index position.

There is no direct way of pulling the array elements by looking up their index numbers. However a workaround is available. The document with `_id:4` in the food collection prior to the update is as follows:

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find({_id:4}).pretty()
{ "_id" : 4, "fruits" : [ "apple", "grapes" ] }
>
```

Act: The update statement is

```
db.food.update({_id:4}, {$unset : {"fruits.1" : null }});
db.food.update({_id:4}, {$pull : {"fruits" : null}});
```

```
C:\Windows\system32\cmd.exe - mongo
> db.food.update({_id:4}, {$unset : {"fruits.1" : null }});
WriteResult({ "nMatched" : 1, "nUpserted" : 0, "nModified" : 1 })
> db.food.update({_id:4}, {$pull : {"fruits" : null}});
WriteResult({ "nMatched" : 1, "nUpserted" : 0, "nModified" : 1 })
>
```

Outcome: After update, the document with `_id:4` in the food collection is

```
C:\Windows\system32\cmd.exe - mongo
> db.food.find({_id:4}).pretty()
{ "_id" : 4, "fruits" : [ "apple" ] }
>
```

6.5.9 Aggregate Function

Objective: Consider the collection “Customers” as given below. It has four documents. We would like to filter out those documents where the “AccType” has a value other than “S”. After the filter, we should be left with three documents where the “Acctype”: “S”. It is then required to group the documents on the basis of CustID and sum up the “AccBal” for each unique “CustID”. This is similar to the output received with group by clause in RDBMS. Once the groups have been formed [as per the example below, there will be only two groups: (a) “CustID” : “C123” and (b) “CustID” : “C111”], filter and display that group where the “TotAccBal” column has a value greater than 1200.

Let us start off by creating the collection “Customers” with the above displayed four documents:

```
db.Customers.insert([{"CustID": "C123", "AccBal": 500, "AccType": "S"}, {"CustID": "C123", "AccBal": 900, "AccType": "S"}, {"CustID": "C111", "AccBal": 1200, "AccType": "S"}, {"CustID": "C123", "AccBal": 1500, "AccType": "C"}]);
```

```
mongod --port 27017 --dbpath D:\MongoDB\mongodata>db.Customers.insert([{"CustID": "C123", "AccBal": 500, "AccType": "S"}, {"CustID": "C123", "AccBal": 900, "AccType": "S"}, {"CustID": "C111", "AccBal": 1200, "AccType": "S"}, {"CustID": "C123", "AccBal": 1500, "AccType": "C"}])>{"writeErrors": [], "writeConcernErrors": [], "nInserted": 4, "nUpserted": 0, "nMatched": 0, "nModified": 0, "nDeleted": 0, "nUpdated": 4}
```

To confirm the presence of four documents in the “Customers” collection, use the below syntax:
`db.Customers.find().pretty();`

```
mongod --port 27017 --dbpath D:\MongoDB\mongodata>db.Customers.find().pretty();
{
  "_id" : ObjectId("54993269f4263d0150bfa72c"),
  "CustID" : "C123",
  "AccBal" : 500,
  "AccType" : "S"

  "_id" : ObjectId("54993269f4263d0150bfa72d"),
  "CustID" : "C123",
  "AccBal" : 900,
  "AccType" : "S"

  "_id" : ObjectId("54993269f4263d0150bfa72e"),
  "CustID" : "C111",
  "AccBal" : 1200,
  "AccType" : "S"

  "_id" : ObjectId("54993269f4263d0150bfa72f"),
  "CustID" : "C123",
  "AccBal" : 1500,
  "AccType" : "C"
}
```

To group on “CustID” and compute the sum of “AccBal”, use the below syntax:

```
db.Customers.aggregate( { $group : { _id : "$CustID", TotAccBal : { $sum : "$AccBal" } } });
```

```
mongod --port 27017 --dbpath D:\MongoDB\mongodata>db.Customers.aggregate( { $group : { _id : "$CustID", TotAccBal : { $sum : "$AccBal" } } })
{
  "_id" : "C111", "TotAccBal" : 1200
  "_id" : "C123", "TotAccBal" : 2900
}
```

In order to first filter on “AccType:S” and then group it on “CustID” and then compute the sum of “AccBal”, use the below syntax:

```
db.Customers.aggregate( { $match : { AccType : "S" } },
{ $group : { _id : "$CustID", TotAccBal : { $sum : "$AccBal" } } });
```

```
mongod --port 27017 --dbpath D:\MongoDB\mongodata>db.Customers.aggregate( { $match : { AccType : "S" } },
{ $group : { _id : "$CustID", TotAccBal : { $sum : "$AccBal" } } })
{
  "_id" : "C111", "TotAccBal" : 1200
  "_id" : "C123", "TotAccBal" : 1400
}
```

In order to first filter on “AccType:S” and then group it on “CustID” and then to compute the sum of “AccBal” and then filter those documents wherein the “TotAccBal” is greater than 1200, use the below syntax:

```
db.Customers.aggregate( { $match : { AccType : "S" } },
{ $group : { _id : "$CustID", TotAccBal : { $sum : "$AccBal" } } },
{ $match : { TotAccBal : { $gt : 1200 } } });
```

```
mongod --port 27017 --dbpath D:\MongoDB\mongodata>db.Customers.aggregate( { $match : { AccType : "S" } },
{ $group : { _id : "$CustID", TotAccBal : { $sum : "$AccBal" } } },
{ $match : { "TotAccBal": { $gt : 1200 } } })
{
  "_id" : "C123", "TotAccBal" : 1400
}
```

To group on “CustID” and compute the average of the “AccBal” for each group:

```
db.Customers.aggregate( { $group : { _id : "$CustID", TotAccBal : { $avg : "$AccBal" } } } );
```

```
> db.Customers.aggregate( { $group : { _id : "$CustID", TotAccBal : { $avg : "$AccBal" } } } );
{ "_id" : "C111", "TotAccBal" : 1200 }
{ "_id" : "C123", "TotAccBal" : 966.666666666666 }
```

To group on “CustID” and determine the maximum “AccBal” for each group:

```
db.Customers.aggregate( { $group : { _id : "$CustID", TotAccBal : { $max : "$AccBal" } } } );
```

```
> db.Customers.aggregate( { $group : { _id : "$CustID", TotAccBal : { $max : "$AccBal" } } } );
{ "_id" : "C111", "TotAccBal" : 1200 }
{ "_id" : "C123", "TotAccBal" : 1500 }
```

To group on “CustID” and determine the minimum “AccBal” for each group:

```
db.Customers.aggregate( { $group : { _id : "$CustID", TotAccBal : { $min : "$AccBal" } } } );
```

```
> db.Customers.aggregate( { $group : { _id : "$CustID", TotAccBal : { $min : "$AccBal" } } } );
{ "_id" : "C111", "TotAccBal" : 1200 }
{ "_id" : "C123", "TotAccBal" : 500 }
```

6.5.10 MapReduce Function

Objective: Consider the collection “Customers” below. There are four documents. Run a query to filter out those documents where the key “AccType” has a value other than “S”. Then for each unique CustID, prepare a list of AccBal values. For example, for CustID: “C123”, the AccBals are 500,900. This task will be assigned to the mapper function. The output from the mapper function serves as the input to the reducer function. The reducer function then aggregates the AccBal for each CustID. For example, for CustID: “C123”, the value is 1400, etc.

Given below is the syntax that we will use to accomplish the objective.

```
db.Customers.mapReduce( {  
    map: function() { emit ( this.CustID, this.AccBal ); },  
    reduce: function(key, values) { return Array.sum (values) },  
    query: { AccType: "S"},  
    output: "Customer_Totals"  
})
```

Map Function

```
var map = function(){  
    emit ( this.CustID, this.AccBal );}  
>> var map = function(){  
... emit ( this.CustID, this.AccBal );}
```

Reduce Function

```
var reduce = function(key, values){ return Array.sum(values) ;}  
> var reduce = function(key, values){ return Array.sum(values) ;}
```

To execute the query

```
db.Customers.mapReduce(map, reduce,{out: "Customer_Totals", query:{AccType:"S"}}, {  
    "result": "Customer_Totals",  
    "timeMillis": 7,  
    "counts": {  
        "input": 3,  
        "emit": 3,  
        "reduce": 1,  
        "output": 2  
    },  
    "ok": 1,
```

The output as archived in “Customer_Totals” collection:

```
> db.Customer_Totals.find().pretty();  
> {"_id": "C111", "value": 1200}  
> {"_id": "C123", "value": 1400}
```

6.5.11 Java Script Programming

Objective: To compute the factorial of a given positive number. The user is required to create a function by the name “factorial” and insert it into the “system.js” collection.

Before we proceed, a quick check on what is contained in the “system.js” collection:

```
> db.system.js.find();  
>
```

As per the screenshot above, currently there are no functions in the system.js collection.

Act:

```
db.system.js.insert({_id:"factorial",
```

```

value:function(n)
{
    if (n==1)
        return 1;
    else
        return n * factorial(n-1);
}
}
);

```

```

> db.system.js.insert({_id:"factorial",
... value:function(n)
... {
...     if (n==1)
...         return 1;
...     else
...         return n * factorial(n-1);
...     }
... });
WriteResult({ "nInserted" : 1 })
>

```

Confirm the presence of the “factorial” function in the system.js collection.

```

> db.system.js.find();
{ "_id": "factorial", "value": function (n)
{
    if (n==1)
        return 1;
    else
        return n * factorial(n-1);
} }

```

To execute the function “factorial”, use the eval() method.

```
db.eval("factorial(3)");
```

```

> db.eval("factorial(3)");
6
>
db.eval("factorial(5)");

```

```
> db.eval("factorial(5)");
120
>
```

```
db.eval("factorial(1)");
```

```
> db.eval("factorial(1)");
1
>
```

6.5.12 Cursors in MongoDB

Objective: To create a collection by the name “alphabets” and insert documents in it containing two fields, “_id” and “alphabet”. The values stored in the “alphabet” field should be “a”, “b”, “c”, “d”, etc. with one value stored per document. There should be 26 documents in all. We need to use cursor to iterate through the “alphabets” collection.

Note: “Alphabets” is the name of the collection and “alphabet” is the name of the field.

Act: To create the collection “alphabets” with its 26 documents.

```
db.alphabets.insert({_id:1,alphabet:"a"});
db.alphabets.insert({_id:2,alphabet:"b"});
```

```
db.alphabets.insert({_id:3,alphabet:"c"});
db.alphabets.insert({_id:4,alphabet:"d"});
db.alphabets.insert({_id:5,alphabet:"e"});
db.alphabets.insert({_id:6,alphabet:"f"});
db.alphabets.insert({_id:7,alphabet:"g"});
db.alphabets.insert({_id:8,alphabet:"h"});
db.alphabets.insert({_id:9,alphabet:"i"});
db.alphabets.insert({_id:10,alphabet:"j"});
db.alphabets.insert({_id:11,alphabet:"k"});
db.alphabets.insert({_id:12,alphabet:"l"});
db.alphabets.insert({_id:13,alphabet:"m"});
db.alphabets.insert({_id:14,alphabet:"n"});
db.alphabets.insert({_id:15,alphabet:"o"});
db.alphabets.insert({_id:16,alphabet:"p"});
db.alphabets.insert({_id:17,alphabet:"q"});
db.alphabets.insert({_id:18,alphabet:"r"});
db.alphabets.insert({_id:19,alphabet:"s"});
db.alphabets.insert({_id:20,alphabet:"t"});
db.alphabets.insert({_id:21,alphabet:"u"});
db.alphabets.insert({_id:22,alphabet:"v"});
db.alphabets.insert({_id:23,alphabet:"w"});
db.alphabets.insert({_id:24,alphabet:"x"});
db.alphabets.insert({_id:25,alphabet:"y"});
db.alphabets.insert({_id:26,alphabet:"z"});
```

```
C:\Windows\system32\cmd.exe - mongo
> db.alphabets.insert({_id:1,alphabet:"a"});
writeResult({ "nInserted" : 1 })
> db.alphabets.insert({_id:2,alphabet:"b"});
writeResult({ "nInserted" : 1 })
> db.alphabets.insert({_id:3,alphabet:"c"});
writeResult({ "nInserted" : 1 })
> db.alphabets.insert({_id:4,alphabet:"d"});
writeResult({ "nInserted" : 1 })
> db.alphabets.insert({_id:5,alphabet:"e"});
writeResult({ "nInserted" : 1 })
> db.alphabets.insert({_id:6,alphabet:"f"});
writeResult({ "nInserted" : 1 })
> db.alphabets.insert({_id:7,alphabet:"g"});
writeResult({ "nInserted" : 1 })
> db.alphabets.insert({_id:8,alphabet:"h"});
writeResult({ "nInserted" : 1 })
> db.alphabets.insert({_id:9,alphabet:"i"});
writeResult({ "nInserted" : 1 })
> db.alphabets.insert({_id:10,alphabet:"j"});
writeResult({ "nInserted" : 1 })
> db.alphabets.insert({_id:11,alphabet:"k"});
writeResult({ "nInserted" : 1 })
> db.alphabets.insert({_id:12,alphabet:"l"});
writeResult({ "nInserted" : 1 })
> db.alphabets.insert({_id:13,alphabet:"m"});
writeResult({ "nInserted" : 1 })
> db.alphabets.insert({_id:14,alphabet:"n"});
writeResult({ "nInserted" : 1 })
> db.alphabets.insert({_id:15,alphabet:"o"});
writeResult({ "nInserted" : 1 })
> db.alphabets.insert({_id:16,alphabet:"p"});
writeResult({ "nInserted" : 1 })
> db.alphabets.insert({_id:17,alphabet:"q"});
writeResult({ "nInserted" : 1 })
> db.alphabets.insert({_id:18,alphabet:"r"});
writeResult({ "nInserted" : 1 })
```

```
> db.alphabets.insert({_id:19,alphabet:"s"});
WriteResult({ "nInserted" : 1 })
> db.alphabets.insert({_id:21,alphabet:"u"});
WriteResult({ "nInserted" : 1 })
> db.alphabets.insert({_id:22,alphabet:"v"});
WriteResult({ "nInserted" : 1 })
> db.alphabets.insert({_id:23,alphabet:"w"});
WriteResult({ "nInserted" : 1 })
> db.alphabets.insert({_id:24,alphabet:"x"});
WriteResult({ "nInserted" : 1 })
> db.alphabets.insert({_id:25,alphabet:"y"});
WriteResult({ "nInserted" : 1 })
> db.alphabets.insert({_id:26,alphabet:"z"});
WriteResult({ "nInserted" : 1 })
>
```

Confirm the presence of 26 documents in the “alphabets” collection.

```
C:\windows\system32\cmd.exe - mongo
> db.alphabets.find()
{
  "_id" : 1, "alphabet" : "a"
}
{
  "_id" : 2, "alphabet" : "b"
}
{
  "_id" : 3, "alphabet" : "c"
}
{
  "_id" : 4, "alphabet" : "d"
}
{
  "_id" : 5, "alphabet" : "e"
}
{
  "_id" : 6, "alphabet" : "f"
}
{
  "_id" : 7, "alphabet" : "g"
}
{
  "_id" : 8, "alphabet" : "h"
}
{
  "_id" : 9, "alphabet" : "i"
}
{
  "_id" : 10, "alphabet" : "j"
}
{
  "_id" : 11, "alphabet" : "k"
}
{
  "_id" : 12, "alphabet" : "l"
}
{
  "_id" : 13, "alphabet" : "m"
}
{
  "_id" : 14, "alphabet" : "n"
}
{
  "_id" : 15, "alphabet" : "o"
}
{
  "_id" : 16, "alphabet" : "p"
}
{
  "_id" : 17, "alphabet" : "q"
}
{
  "_id" : 18, "alphabet" : "r"
}
{
  "_id" : 19, "alphabet" : "s"
}
{
  "_id" : 20, "alphabet" : "t"
}
Type "it" for more
>
```

A quick word on how the db.collection.find() method works. This is the primary method for read operation. In other words, it allows one to fetch the documents from the collection. To be able to access the documents, one needs to iterate the cursor.

However, in the mongo shell, if the returned cursor is not assigned to a variable using the var keyword, then cursor is automatically iterated up to 20 times to print the first 20 documents in the result.

```
C:\windows\system32\cmd.exe - mongo
> var myCursor = db.alphabets.find();
myCursor:
{
  "_id" : 1, "alphabet" : "a"
}
{
  "_id" : 2, "alphabet" : "b"
}
{
  "_id" : 3, "alphabet" : "c"
}
{
  "_id" : 4, "alphabet" : "d"
}
{
  "_id" : 5, "alphabet" : "e"
}
{
  "_id" : 6, "alphabet" : "f"
}
{
  "_id" : 7, "alphabet" : "g"
}
{
  "_id" : 8, "alphabet" : "h"
}
{
  "_id" : 9, "alphabet" : "i"
}
{
  "_id" : 10, "alphabet" : "j"
}
{
  "_id" : 11, "alphabet" : "k"
}
{
  "_id" : 12, "alphabet" : "l"
}
{
  "_id" : 13, "alphabet" : "m"
}
{
  "_id" : 14, "alphabet" : "n"
}
{
  "_id" : 15, "alphabet" : "o"
}
{
  "_id" : 16, "alphabet" : "p"
}
{
  "_id" : 17, "alphabet" : "q"
}
{
  "_id" : 18, "alphabet" : "r"
}
{
  "_id" : 19, "alphabet" : "s"
}
{
  "_id" : 20, "alphabet" : "t"
}
Type "it" for more
>
```

Let us now look at designing manual cursors to iterate through the documents in the “alphabets” collection. We will use two methods with manual cursors: hasNext() and next(). We now quickly explain the two methods.

Method 1: hasNext() method. Return value: Boolean. The hasNext() method returns true if the cursor returned by the db.Collection.find() query can iterate further to return more documents.

Method 2: next() method. The next() method returns the next document in the cursor as returned by the db.collection.find() method.

```
C:\Windows\system32\cmd.exe - mongo
> var myCur=db.alphabets.find({}); 
> while(!myCur.hasNext()){
... var myRec=myCur.next();
... print("The alphabet is : " + myRec.alphabet);
...
The alphabet is : a
The alphabet is : b
The alphabet is : c
The alphabet is : d
The alphabet is : e
The alphabet is : f
The alphabet is : g
The alphabet is : h
The alphabet is : i
The alphabet is : j
The alphabet is : k
The alphabet is : l
The alphabet is : m
The alphabet is : n
The alphabet is : o
The alphabet is : p
The alphabet is : q
The alphabet is : r
The alphabet is : s
The alphabet is : t
The alphabet is : u
The alphabet is : v
The alphabet is : w
The alphabet is : x
The alphabet is : y
The alphabet is : z
>
```

The same result can be obtained by iterating through the cursor using a forEach loop.

```
C:\Windows\system32\cmd.exe - mongo
> var cur=db.alphabets.find({}); 
> var myRec;
> cur.forEach( function(myRec) {
... print("The alphabet is : " + myRec.alphabet);
...
});
The alphabet is : a
The alphabet is : b
The alphabet is : c
The alphabet is : d
The alphabet is : e
The alphabet is : f
The alphabet is : g
The alphabet is : h
The alphabet is : i
The alphabet is : j
The alphabet is : k
The alphabet is : l
The alphabet is : m
The alphabet is : n
The alphabet is : o
The alphabet is : p
The alphabet is : q
The alphabet is : r
The alphabet is : s
The alphabet is : t
The alphabet is : u
The alphabet is : v
The alphabet is : w
The alphabet is : x
The alphabet is : y
The alphabet is : z
>
```

6.5.13 Indexes

Assume the collection with the following documents:

```
> db.books.find().pretty();
{
    "_id" : 6,
    "Category" : "Machine Learning",
    "Bookname" : "Machine Learning for Hackers",
    "Author" : "Drew Conway",
    "qty" : 25,
    "price" : 400,
    "rol" : 30,
    "pages" : 350

    "_id" : 7,
    "Category" : "Web Mining",
    "Bookname" : "Mining the Social Web",
    "Author" : "Matthew A. Russell",
    "qty" : 55,
    "price" : 500,
    "rol" : 30,
    "pages" : 250

    "_id" : 8,
    "Category" : "Python",
    "Bookname" : "Python for Data Analysis",
    "Author" : "Wes McKinney",
    "qty" : 8,
    "price" : 150,
    "rol" : 20,
    "pages" : 150

    "_id" : 9,
    "Category" : "Visualization",
    "Bookname" : "Visualizing Data",
    "Author" : "Ben Fry",
    "qty" : 12,
    "price" : 325,
    "rol" : 6,
    "pages" : 450

    "_id" : 10,
    "Category" : "Web Mining",
    "Bookname" : "Algorithms for the intelligent web",
    "Author" : "Haralambos Marmanis",
    "qty" : 5,
    "price" : 850,
    "rol" : 10,
    "pages" : 120
}
```

Create an index on the key "Category" in the "books" collection.

```
> db.books.ensureIndex({"Category":1});
{
    "createdCollectionAutomatically" : false,
    "numIndexesBefore" : 1,
    "numIndexesAfter" : 2,
    "ok" : 1
}
```

Check on the status, that is, number and name of the indexes:

```
> db.books.stats();
{
    "ns" : "test.books",
    "count" : 5,
    "size" : 1200,
    "avgObjSize" : 240,
    "storageSize" : 8192,
    "numExtents" : 1,
    "nindexes" : 2,
    "lastExtentSize" : 8192,
    "paddingFactor" : 1,
    "systemFlags" : 1,
```

```

"userFlags" : 1,
"totalIndexSize" : 16352,
"indexSizes" : {
    "_id_" : 8176,
    "Category_1" : 8176
},
"ok" : 1

```

Get the list of all indexes on the “books” collection:

```

> db.books.getIndexes();
{
    {
        "v" : 1,
        "key" : {
            "_id" : 1
        },
        "name" : "_id_",
        "ns" : "test.books"
    },
    {
        "v" : 1,
        "key" : {
            "Category" : 1
        },
        "name" : "Category_1",
        "ns" : "test.books"
    }
}

```

To use the index on “Category” in the “books” collection, use the hint method:

```

> db.books.find({"Category":"Web Mining"}).pretty().hint({"Category":1});
{
    "_id" : 7,
    "Category" : "Web Mining",
    "Bookname" : "Mining the Social Web",
    "Author" : "Matthew A.Russell",
    "qty" : 55,
    "price" : 500,
    "rol" : 30,
    "pages" : 250

    "_id" : 10,
    "Category" : "Web Mining",
    "Bookname" : "Algorithms for the intelligent web",
    "Author" : "Haralambos Marmanis",
    "qty" : 5,
    "price" : 850,
    "rol" : 10,
    "pages" : 120
}

```

Check the explain plan to get a deeper understanding on the use of index.

```

> db.books.find({"Category":"Web Mining"}).pretty().hint({"Category":1}).explain();
{
    "cursor" : "BtreeCursor Category_1",
    "isMultiKey" : false,
    "n" : 2,
    "nscannedObjects" : 2,
    "nscanned" : 2,
    "nscannedObjectsAllPlans" : 2,
    "nscannedAllPlans" : 2,
    "scanAndOrder" : false,
    "indexOnly" : false,
    "nYields" : 0,
    "nChunkSkips" : 0,
}

```

```

"millis" : 0,
"indexBounds" : {
  "Category" : [
    [
      "Web Mining",
      "Web Mining"
    ]
  ]
},
"server" : "PUNITP123103L:27017",
"filterSet" : false
}

```

Let us look at the case of covered index. Observe that the “indexOnly” property will be set to true for covered index.

```

> db.books.find({"Category": "Web Mining"}, {"Category": 1, "_id": 0}).pretty().hint({"Category": 1}).explain();
{
  "cursor" : "BtreeCursor Category_1",
  "isMultiKey" : false,
  "n" : 2,
  "nscannedObjects" : 0,
  "nscanned" : 2,
  "nscannedAllPlans" : 0,
  "nscannedAllPlans" : 2,
  "scanAndOrder" : false,
  "indexOnly" : true,
  "nYields" : 0,
  "nChunkSkips" : 0,
  "millis" : 0,
  "indexBounds" : {
    "Category" : [
      [
        "Web Mining",
        "Web Mining"
      ]
    ]
  },
  "server" : "PUNITP123103L:27017",
  "filterSet" : false
}

```

In order to have the index cover the query, ensure that only those columns are projected on which the index is built. In the above example, the index is built on the “Category” column, and “Category” is the only column that is projected. Even the identifier (_id) is suppressed.

6.5.14 Mongolimport

This command used at the command prompt imports CSV (Comma Separated Values) or TSV (Tab Separated Values) files or JSON (Java Script Object Notation) documents into MongoDB.

Objective: Given a CSV file “sample.txt” in the D: drive, import the file into the MongoDB collection, “SampleJSON”. The collection is in the database “test”.

The “sample.txt” file is as follows:

```

_id,FName,LName
1,Samuel,Jones
2,Virat,Kumar
3,Raul,"A Simpson"
4,"Andrew Simon"

```

Act:

At the command prompt, execute the following command:

```
Mongoimport --db test --collection SampleJSON --type csv --headerline --file d:\sample.txt
```

On successful execution of the command, the message at the prompt will be as follows:

```
connected to: 127.0.0.1
2015-02-20T21:09:27.301+0530 imported 4 objects
```

Output: To confirm the output, log into MongoDB shell and navigate to the “SampleJSON” collection in the “test” database.

The following are the JSON documents in the collection:

```
> db
test
> show collections
Customers
SampleJSON
books
fs.chunks
fs.files
persons
system.indexes
usercounters
users
> db.SampleJSON.find().pretty();
[{"_id": 1, "FName": "Samuel", "LName": "Jones"}, {"_id": 2, "FName": "Virat", "LName": "Kumar"}, {"_id": 3, "FName": "Raul", "LName": "A Simpson"}, {"_id": 4, "FName": "", "LName": "Andrew Simon"}]
```

6.5.15 MongoExport

This command used at the command prompt exports MongoDB JSON documents into CSV (Comma Separated Values) or TSV (Tab Separated Values) files or JSON (Java Script Object Notation) documents.

Objective: This command used at the command prompt exports MongoDB JSON documents from “Customers” collection in the “test” database into a CSV file “Output.txt” in the D: drive.

Given below is a snapshot of the JSON documents in the “Customers” collection of the “test” database.

```
> db
test
> show collections
Customers
SampleJSON
books
fs.chunks
fs.files
persons
system.indexes
usercounters
users
> db.Customers.find().pretty();
[{"_id": ObjectId("54df6d4f46a31d28183b9a5b"), "CustID": "C123", "AccBal": 500, "AccType": "S"}, {"_id": ObjectId("54df6d4f46a31d28183b9a5c"), "CustID": "C123", "AccBal": 900, "AccType": "S"}]
```

```
{
  "_id" : ObjectId("54df6d4f46a31d28183b9a5d"),
  "CustID" : "C111",
  "AccBal" : 1200,
  "AccType" : "S"
}
{
  "_id" : ObjectId("54df6d4f46a31d28183b9a5e"),
  "CustID" : "C123",
  "AccBal" : 1500,
  "AccType" : "C"
}
>
```

Act: At the command prompt, execute the following command:

```
Mongoexport --db test --collection Customers --csv --fieldFile d:\fields.txt --out d:\output.txt
```

Before executing this command, ensure that you have created a “fields.txt” with a format defined as follows. The “fields.txt” file:

```
CustID
AccBal
AccType
```

For the MongoExport command to execute successfully, ensure that the fields are spelt as is in the MongoDB collection. The case also has to be maintained. It is mandatory to ensure that only one field name is placed per line.

On successful execution of the command, the message at the prompt will be as follows:

```
|connected to: 127.0.0.1
|exported 4 records
```

Output: To confirm the output, navigate to the D: drive and check the file “Output.txt”.

```
"Output.txt"
CustID,AccBal,AccType
"C123",500.0,"S"
"C123",900.0,"S"
"C111",1200.0,"S"
"C123",1500.0,"C"
```

6.5.16 Automatic Generation of Unique Numbers for the “_id” Field

Step 1: Run the insert() method on a new collection “usercounters”. This is to start off with an initial value of 0 for the “seq” field.

```
db.usercounters.insert(
{
  _id: "empid",
  seq:0
})
```

Step 2: Create a user-defined function “getnextseq”. This method will invoke “findAndModify()” method on the “usercounters” collection. This is to increment the value of seq field by 1 and update the same in “usercounters” collection.

```
function getnextseq(name) {  
    var ret=db.usercounters.findAndModify(  
    {  
        query: {_id:name},  
        update: {$inc:{seq:1}},  
        new:true  
    }  
    );  
    return ret.seq;  
}
```

Step 3: Run the insert() method on the collection where you need to have the “_id” field and get the uniquely generated number. Notice the call to getnextseq() method as value to _id. The return value from the getnextseq() method becomes the value of _id.

```
db.users.insert(  
{  
    _id:getnextseq("empid"),  
    Name: "sarah jane"  
})  
)
```

REMIND ME

- MongoDB is a non-relational, open source, distributed database.
- It stores data into JSON (Java Script Object Notation) documents.
- It adheres to CP (Consistency and Partition Tolerant) traits of Brewer's CAP theorem.
- It has NO support for multi-statement transactions.
- It supports embedded documents.
- It practices automatic sharding.

POINT ME (BOOK)

- MongoDB: The definitive guide by Kristina Chodorow, Michael Dirolf, O'Reilly Media.
